<u>D. Validation Rubric</u>	5
<u>E. Description of Statistical Analysis Protocols</u>	9
<u>F. Data Validation Report Table</u>	14

Dear LEA Colleagues,

Thank you for participating in the Teacher Incentive Allotment. We recognize the significance of this decision and admire your willingness to benefit students, teachers, and the LEA through this program.

Purpose of this document

This document provides a *summary* of the Step 2 Data Validation process in three sections.

- The first is a reader-friendly description of the statistics used in each check and the type of evidence each check provides toward validating a district's system for designation.
- The second section contains the Validation Scoring Rubric. This rubric is used to summarize evidence and assign points for each check. Ultimately, scores on the rubric allow the Texas Education Agency (TEA) to determine if sufficient evidence exists to support the conclusion that a district's designation system will result in valid teacher selections. A district need not score perfectly on every dimension, but component scores, taken together, help TEA make decisions about a district's system.
- For those interested in a deeper understanding of the data validation checks, the third section contains additional explanations about each of the statistical procedures, test statistics, and decision rules for assigning points on the rubric.

This resource is intended to provide a big picture perspective of the checks performed by Texas Tech on the data submitted by LEAs. We recommend that you read this document first before reviewing the [data template](#), and keeping it handy while your data file is being prepared. If you have questions about this summary, please contact TIA@ttu.edu.

Procedural changes

A change was made that affects Step 2 for Year 5. This change was made to ensure clear and transparent ratings and establish a process that guarantees rigor and fair scoring for all LEAs regardless of size, demographics, or the local designation plan.

The change involves a shift to an *adjusted* VAM model. For the 2023-24 data validation check (using data from the 2022-23 school year), districts will be scored on both an adjusted model and the current unadjusted model. The highest overall data validation results will be taken. For the 2024-25 data validation check (using data from the 2023-2024 school year) the data will only be scored based on the adjusted model. We will no longer use the unadjusted model after this year. The impacted checks are 2, 3, 4, 10, and the new supplementary checks 12 and 13.

Additionally, beginning this year, a small number of districts, who may be on the cusp of passing as identified by TEA's review, will have the opportunity to submit an appeal of the decision. The appeals process will involve an opportunity to provide additional qualitative and quantitative context, which will then be reviewed. A district with a granted appeal will receive a one-year provisional approval and must receive full approval the following year to continue to designate teachers. More details will be available for districts who qualify for this opportunity.

Additional changes to the checks and data validation scoring process are listed below. If you have questions about this summary or these changes, please contact TIA@ttu.edu.

Sincerely,

Texas Tech Team for TIA

Summary of Changes to Data Validation Checks

Overview of Changes:

2023-24 Check Number	Domain	Prior Check Number	Weight	Change
1	A	1	10	Changed weight and scoring rubric
2	B	2	7	Changed weight and scoring rubric
3	B	3	3	Changed weight and scoring rubric
4	C	4	3	Changed weight and scoring rubric
5	C	5	2	Changed scoring rubric
6	C	6	3	Changed weight and scoring rubric
7	C	7	2	Changed scoring rubric
8	D	8	1	Changed scoring rubric
9	D	9	1	Changed scoring rubric
10 (supp)	E	10 (supp)	0	Changed scoring rubric
11 (supp)	E	11 (supp)	0	Changed scoring rubric
12 (supp)	E	NA	0	New supplemental check
13 (supp)	E	NA	0	New supplemental check

New Supplemental (unscored) Check 12 and Check 13:

We will examine rank correlations between observation scores (Check 12) or growth scores (Check 13) and VAM scores among teachers of tested subjects. These checks are intended to help system administrators gauge the level of agreement between the rankings of teachers within the district on observation/growth and VAM scores. For this year, these checks are unscored and may be considered as a scored check in the future.

12. The ranking of teachers based on observation scores closely aligns with their ranking on statewide performance standards for teaching proficiency.

0 points $\rho \leq 0$	0-1 points $\frac{\rho - 0}{0.10 - 0}$	1 point $\rho = 0.10$	1-2 points $\frac{\rho - 0.10}{0.37 - 0.10} + 1$	2 points $\rho = 0.37$	2-3 points $\frac{\rho - 0.37}{0.64 - 0.37} + 2$	3 points $\rho \geq 0.64$
----------------------------------	--	---------------------------------	--	----------------------------------	--	-------------------------------------

13. The ranking of teachers based on percentages of student growth closely aligns with their ranking on statewide performance standards for teaching proficiency.

0 points $\rho \leq 0$	0-1 points $\frac{\rho - 0}{0.10 - 0}$	1 point $\rho = 0.10$	1-2 points $\frac{\rho - 0.10}{0.25 - 0.10} + 1$	2 points $\rho = 0.25$	2-3 points $\frac{\rho - 0.25}{0.50 - 0.25} + 2$	3 points $\rho \geq 0.50$
----------------------------------	--	---------------------------------	--	----------------------------------	--	-------------------------------------

Reader-Friendly Description of Data Validation Checks

The analyses described below are intended to validate the district designation system by comparing designations with external data and performing internal consistency checks. The purpose is to confirm that the district system functions in a manner that meets certain reliability (consistency) and validity (accuracy) standards, not to confirm or reject the designation of individual teachers. Meeting these standards allows stakeholders to have confidence that the designation system is fair and accurate.

Domain A. Correlation between teacher observation ratings and student performance ratings
Check 1 The correlation coefficient between observation and growth among all eligible teachers is within the range of expected magnitude reported in the research literature.
For this check, analysts calculate the correlation coefficient (Pearson product-moment correlation) between teacher observation scores and student growth scores submitted by the district. This analysis involves looking for a trend or pattern in the relation between teaching proficiency (i.e., observation scores) and the learning gain exhibited by students (i.e., student growth). Based upon findings reported in peer-reviewed research literature, the expectation is that the trend or relation will be at least minimally positive. For example, the analysts will expect to see that teachers who are assigned higher observation ratings by appraisers will also have students that exhibit greater growth. Conversely, teachers who are assigned lower observation ratings by an appraiser would be expected to have students who exhibited less growth. Results from this analysis provide one piece of evidence about the validity of the designation system.
Domain B. Confirm relation between district designations and student growth calculations
Check 2 District designations of Recognized, Exemplary, and Master (REM) teachers are found in similar proportion to designations as determined by the state-wide VAM.
For this check, analysts calculate a rank correlation coefficient (Kendall's tau) between the designation category assigned to a teacher by the district and the equivalent category derived from state-level value-added scores calculated for teachers in the district. This analysis uses district data from SY2022-2023 restricted to the group of teachers whom the district has designated and for whom a state-level STAAR-based value-added score can be calculated. This analysis looks at the <u>rank</u> of the designation (REM) and compares it to the <u>rank</u> derived from a value-added score. The expectation is that teachers assigned a Master designation would have a higher-ranking designation as determined by the state-wide VAM than those with an Exemplary designation and that teachers with this designation would have a higher-ranking designation as determined by the state-wide VAM than those with a Recognized designation. Results from this analysis provide another piece of evidence about the validity of the designation system.
Check 3 District designation decisions for REM teachers, in tested subjects, are in proximity to designations as determined by the state-wide VAM.
For this check, analysts examine the accuracy with which local designation systems designate each eligible teacher in a tested subject based on calculations of the designations if they were determined by the state-wide VAM. The table below shows how scores are calculated based on the proximity of district designation to the designation if it was determined by the state-wide VAM. Scores reflect a positive value for accurate designation, and a negative value for decisions that are not aligned with designations if they had been determined by the state-wide VAM. For example, if a local system designates a teacher as Exemplary, and this designation is consistent with the designation determined by the state-wide VAM, then an accuracy score of 1.00 is assigned. On the other hand, if a local system designates a teacher as Master, but the designation as determined by the state-wide VAM indicates no designation should be made, then an accuracy score of -1.00 is assigned. The expectation is that local systems will accurately identify teachers, and their levels, for designation. This analysis provides evidence about the concurrent validity of the local designation system.

District Designations	Designations if determined by the state-wide VAM			
	<i>Not Designated</i>	<i>Recognized</i>	<i>Exemplary</i>	<i>Master</i>
<i>Recognized</i>	0.00	1.00	0.75	0.50
<i>Exemplary</i>	-0.25	0.75	1.00	0.75
<i>Master</i>	-1.00	0.25	0.75	1.00

Domain C. Degree of reliability for observation and growth judgements

Check 4

Across campuses, observation scores are similar for teachers in REM groups.

For this check, analysts use an analysis of variance (ANOVA) to calculate the extent to which there are similarities in observation scores for REM teachers across campuses. The expectation is that there will be small, statistically non-significant differences between the same designation levels across campuses within the district. That is, observation scores for teachers designated at the Master level are expected to be comparable regardless of campus. Similar analyses are performed for the observation scores associated with teachers in the other designation groups. If the expected level of consistency is found in the observation data, it provides evidence about the reliability of the district's designation system.

Check 5

Across campuses, percentages of student growth are similar for teachers in REM groups.

This check is like Check 4 in that ANOVA is used to calculate similarities for REM teachers across campuses. In this case, however, analysts are interested in comparing student growth scores, or the percentage of students who meet or exceed learning expectations. As above, the expectation is that there will be small, statistically non-significant differences between the same designation levels across campuses within the district. That is, growth scores associated with teachers designated at the Master level are expected to be comparable regardless of campus; and similar analyses are performed for the growth scores associated with teachers in the other designation groups. If the expected level of consistency is found in student-growth data, it provides evidence about the reliability of the district's designation system.

Check 6

Across assignments, observation scores are similar for teachers in REM groups.

This check is also like Check 4, but instead of making comparisons across campuses, it looks for similarities in observation ratings within REM groups across teaching assignment. As before, ANOVA is used to calculate similarities among designation groups based on teaching assignments. Teaching assignments and the subsequent comparisons will be defined in one of two ways, based upon the data provided by the district.

- First, assignment may mean looking at similarities in observation scores across eligible teacher groups as identified in the district TIA application; or if districts identify only one group of eligibility, and
- Second, assignment may mean looking at similarities in observation scores across teachers in STAAR-tested vs. non STAAR-tested assignments (e.g., Grade 3 math vs. Grade 5 science).

If the expected level of consistency is found in observation data across assignments, it provides evidence about the reliability of the district's designation system.

Check 7

Across assignments, percentages of student growth are similar for teachers in REM groups.

This check is like Check 5, but instead of making comparisons in observation, the comparison is of student growth (percentage of students who meet or exceed learning expectations) within the REM groups across teaching assignment. As before, teaching assignment will be defined as eligible teacher groups or STAAR-tested vs. non-STAAR-tested, depending on the district system and the eligible teacher groups put forward for designation. This check is the last of four checks that are intended to provide evidence about the reliability of the district's designation system.

Domain D. Comparison of district designation percentage to statewide performance standards

Check 8

The percentage of students who meet or exceed expected growth in the district is approximately equal to the statewide performance standards for student growth in each of the teacher-designation levels (REM).

Check 9

Observation ratings in the district are approximately equal to the statewide performance standards for teaching proficiency in each of the teacher-designation levels (REM).

Both checks involve simple comparisons between statewide performance standards for each designation level and district-level results. Performance standards were calculated for both student growth and teacher observation ratings for the top 33% (Recognized level), top 20% (Exemplary level) and top 5% (Master level).

Performance standards for student growth are set for each designation level (i.e., Recognized = 55%; Exemplary = 60%; Master = 70%). The district's results for the percentage of students who meet or exceed growth are compared to the performance standards. District results that meet the designation performance standards from the state are considered to be a match, but those that fall below the state standard are considered to be a mismatch.

Performance standards for teacher observation are also set for each designation level based on the average number of points assigned by appraisers for Domain 2 and 3 of T-TESS (i.e., Recognized = 3.7 points; Exemplary = 3.9 points; and Master = 4.5 points). The district's results for appraiser ratings are compared to the performance standards. District point values that meet the performance standards are considered to be a match, but those that fall below are considered to be a mismatch. In cases where districts use an observation other than T-TESS, a crosswalk between the rubrics is performed and equivalent levels are set (i.e., Recognized = 74% of possible points; Exemplary = 78% of possible points; Master = 90% of possible points).

The scoring criteria for these analyses will be based on the number of designation groups with which district data matches the performance standard for growth and observation scores. A greater number of points will be awarded when there is a greater number of groups with which district designations match the levels described above. Results from these analyses provide evidence about the validity of the designation system.

Domain E. Supplemental system checks (not scored)

Check 10

The proportion of teachers on district campuses who are designated as Recognized, Exemplary, or Master is roughly equivalent to other campuses with the same Domain 2A rating.

The purpose of this check is to examine patterns in designation groups and compare them to district campuses with the same Domain 2A ratings. The expectation is that a district's proportion of designated teachers across all campuses with a specific rating will be like other campuses across the state with the same rating. Results from analyses provide evidence about how well districts have calibrated their system to state standards as well as outcomes found among similarly rated peer districts across the state. Results from this analysis also provide evidence about the validity of the designation system. For the 2023 Step 2 Data Validation process, TEA will use 2022-23 Domain 2a ratings. Any district submitting a campus receiving a "Not Rated" label will be excluded from this analysis for comparison purposes.

The scoring criteria reflect the size of the difference between the proportion of teachers designated by the district, and the proportion of designated teachers found in statewide averages of districts with the same Domain 2A ratings. Smaller differences in proportion (i.e., less than or equal to 0.10 difference) earn more points. Districts with proportions that differ from the statewide average by more than 0.70 receive "0" points on this check.

Check 11

The variability in observation ratings among all eligible teachers is within the range of historical magnitude.

The purpose of this check is to display for leaders of the district's TIA initiative the spread of teacher observation scores gathered during the data capture year. For this check, analysts calculate standard deviation of (max-scaled) observation scores among all eligible teachers.

The expectation is that observation scores for the district will be distributed in a manner that gives some evidence about the ability of the local system to differentiate between ineffective and effective instruction.

Check 12

The ranking of teachers based on observation scores closely aligns with their ranking on statewide performance standards for teaching proficiency.

Check 13

The ranking of teachers based on percentages of student growth closely aligns with their ranking on statewide performance standards for teaching proficiency.

For these checks, analysts calculate a rank correlation coefficient (Spearman's ρ) between observation scores (Check 12) or student growth scores (Check 13) and state-level value-added scores calculated for teachers in the district. This analysis uses district data from SY2022-2023 restricted to the group of teachers for whom a state-level STAAR-based value-added score can be calculated. This analysis looks at the rank of the observation or growth score and compares it to the rank derived from a value-added score. The expectation is that teachers with a higher-ranking on the observation or growth score would have a higher-ranking as determined by the state-wide VAM. Results from this analysis provide another piece of evidence about the validity of the designation system.

Validation Rubric

None or almost no evidence supports judgements	Limited evidence supports the accuracy of judgements	Some evidence points toward the accuracy of judgements	Most evidence supports the accuracy of judgements
Score of 0	Score of 1	Score of 2	Score of 3

Domain A. Correlation between teacher observation ratings and student performance ratings

This check is intended to confirm that teachers' appraisal scores are related to student growth scores.

1. The correlation coefficient between observation and growth among all *eligible* teachers is within the range of expected magnitude reported in research literature.

Earned points x 10 = weighted score for this check

0 points $r \leq 0$	0-1 points $\frac{r - 0}{0.08 - 0}$	1 point $r = 0.08$	1-2 points $\frac{r - 0.08}{0.16 - 0.08} + 1$	2 points $r = 0.16$	2-3 points $\frac{r - 0.16}{0.24 - 0.16} + 2$	3 points $r \geq 0.24$
-------------------------------	---	------------------------------	---	-------------------------------	---	----------------------------------

Domain B. Confirm the relation between district designations and VAM

These checks are intended to confirm that district designations are aligned with state-level student-growth calculations. For the current year, this analysis compares district designations to SY2022-2023 VAM data.

2. District designations of Recognized, Exemplary and Master (REM) teachers are found in similar proportion to designations as determined by the state-wide VAM.

Earned points x 7 = weighted score for this check

0 points $\tau \leq 0$	0-1 points $\frac{\tau - 0}{0.10 - 0}$	1 point $\tau = 0.10$	1-2 points $\frac{\tau - 0.10}{0.30 - 0.10} + 1$	2 points $\tau = 0.30$	2-3 points $\frac{\tau - 0.30}{0.50 - 0.30} + 2$	3 points $\tau \geq 0.50$
----------------------------------	--	---------------------------------	--	----------------------------------	--	-------------------------------------

3. District designations for REM teachers, in tested subjects, are in proximity to designations as determined by the state-wide VAM.

Earned points x 3 = weighted score for this check

0 points $s \leq 0$	0-1 points $\frac{s - 0}{0.10 - 0}$	1 point $s = 0.10$	1-2 points $\frac{s - 0.10}{0.30 - 0.10} + 1$	2 points $s = 0.30$	2-3 points $\frac{s - 0.30}{0.70 - 0.30} + 2$	3 points $s \geq 0.70$
-------------------------------	---	------------------------------	---	-------------------------------	---	----------------------------------

Domain C. Degree of reliability for observation and growth judgements

These checks are intended to confirm that observation ratings and student performance are determined in a consistent manner across campus and teaching assignment.¹

4. Across campuses, observation scores are similar for teachers in REM groups.

Earned points x 3 = weighted score for this check

0 points $sp. \omega^2$ ≥ 0.25	0-1 points $\frac{0.25 - sp. \omega^2}{0.25 - 0.14}$	1 point $sp. \omega^2$ $= 0.14$	1-2 points $\frac{0.14 - sp. \omega^2}{0.14 - 0.06} + 1$	2 points $sp. \omega^2$ $= 0.06$	2-3 points $\frac{0.06 - sp. \omega^2}{0.06 - 0.01} + 2$	3 points $sp. \omega^2$ ≤ 0.01
--	--	--	--	---	--	--

5. Across campuses, percentages of student growth are similar for teachers in REM groups.

Earned points x 2 = weighted score for this check

0 points $sp. \omega^2$ ≥ 0.25	0-1 points $\frac{0.25 - sp. \omega^2}{0.25 - 0.14}$	1 point $sp. \omega^2$ $= 0.14$	1-2 points $\frac{0.14 - sp. \omega^2}{0.14 - 0.06} + 1$	2 points $sp. \omega^2$ $= 0.06$	2-3 points $\frac{0.06 - sp. \omega^2}{0.06 - 0.01} + 2$	3 points $sp. \omega^2$ ≤ 0.01
--	--	--	--	---	--	--

6. Across assignments, observation scores are similar for teachers in REM groups.

Earned points x 3 = weighted score for this check

0 points $sp. \omega^2$ ≥ 0.25	0-1 points $\frac{0.25 - sp. \omega^2}{0.25 - 0.14}$	1 point $sp. \omega^2$ $= 0.14$	1-2 points $\frac{0.14 - sp. \omega^2}{0.14 - 0.06} + 1$	2 points $sp. \omega^2$ $= 0.06$	2-3 points $\frac{0.06 - sp. \omega^2}{0.06 - 0.01} + 2$	3 points $sp. \omega^2$ ≤ 0.01
--	--	--	--	---	--	--

7. Across assignments, percentages of student growth are similar for teachers in REM groups.

Earned points x 2 = weighted score for this check

0 points $sp. \omega^2$ ≥ 0.25	0-1 points $\frac{0.25 - sp. \omega^2}{0.25 - 0.14}$	1 point $sp. \omega^2$ $= 0.14$	1-2 points $\frac{0.14 - sp. \omega^2}{0.14 - 0.06} + 1$	2 points $sp. \omega^2$ $= 0.06$	2-3 points $\frac{0.06 - sp. \omega^2}{0.06 - 0.01} + 2$	3 points $sp. \omega^2$ ≤ 0.01
--	--	--	--	---	--	--

¹ Observation and growth should be equal when compared across campuses and assignments. A smaller effect-size indicates small differences, thus a greater level of agreement. A larger effect-size indicates larger differences, thus a smaller level of agreement.

Domain D. Comparison of district designation percentage to statewide performance standards

These checks are intended to confirm that designation rates in each district are aligned with statewide projections of the proportion of designated teachers in each district.

8. *The percentage of students who meet or exceed expected growth in the district is approximately equal to the statewide performance standards for student growth in each of the teacher-designation levels (REM).*

Earned points x 1 = weighted score for this check

0 points $s \leq 0.55$	0-1 points $\frac{s - 0.55}{0.60 - 0.55}$	1 point $s = 0.60$	1-2 points $\frac{s - 0.60}{0.65 - 0.60} + 1$	2 points $s = 0.65$	2-3 points $\frac{s - 0.65}{0.70 - 0.65} + 2$	3 points $s \geq 0.70$
----------------------------------	---	------------------------------	---	-------------------------------	---	----------------------------------

9. *Observation ratings in the district are approximately equal to the statewide performance standards for teaching proficiency in each of the REM levels.*

Earned points x 1 = weighted score for this check

0 points $s \leq 0.50$	0-1 points $\frac{s - 0.50}{0.60 - 0.50}$	1 point $s = 0.60$	1-2 points $\frac{s - 0.60}{0.70 - 0.60} + 1$	2 points $s = 0.70$	2-3 points $\frac{s - 0.70}{0.80 - 0.70} + 2$	3 points $s \geq 0.80$
----------------------------------	---	------------------------------	---	-------------------------------	---	----------------------------------

Domain E. Supplemental Checks

These checks are intended to provide additional, non-scored evidence to districts about the validity of their local designation system. Check #10 reflects the degree to which designation decisions are comparable among districts with the same Domain 2A ratings. Check #11 shows the variance in district's teacher observation scores as an indicator of the extent to which observers differentiate between more effective and less effective instruction. Checks #12 and #13 indicate the level of agreement between the rankings of teachers within the district on observation/growth and VAM scores. For the current year, these checks are supplemental and are not factored into data validation scores or system validation decisions.

10. The proportion of teachers on district campuses who are designated as *Recognized*, *Exemplary*, or *Master* is roughly equivalent to other campuses with the same Domain 2A rating.

No points assigned for supplemental check

0 points	0-1 points	1 point	1-2 points	2 points	2-3 points	3 points
w	$\frac{0.70 - w}{0.70 - 0.50}$	w	$\frac{0.50 - w}{0.50 - 0.30} + 1$	w	$\frac{0.30 - w}{0.30 - 0.10} + 2$	w
≥ 0.70		$= 0.50$		$= 0.30$		≤ 0.10

11. The variability in observation ratings among all eligible teachers is within the range of expected magnitude.

No points assigned for supplemental check

0 points	0-1 points	1 point	1-2 points	2 points	2-3 points	3 points
$\sigma \leq 0.06$	$\frac{\sigma - 0.06}{0.08 - 0.06}$	$\sigma = 0.08$	$\frac{\sigma - 0.08}{0.10 - 0.08} + 1$	$\sigma = 0.10$	$\frac{\sigma - 0.10}{0.12 - 0.10} + 2$	$\sigma \geq 0.12$

12. The ranking of teachers based on observation scores closely aligns with their ranking on statewide performance standards for teaching proficiency.

No points assigned for supplemental check

0 points	0-1 points	1 point	1-2 points	2 points	2-3 points	3 points
$\rho \leq 0$	$\frac{\rho - 0}{0.10 - 0}$	$\rho = 0.10$	$\frac{\rho - 0.10}{0.37 - 0.10} + 1$	$\rho = 0.37$	$\frac{\rho - 0.37}{0.64 - 0.37} + 2$	$\rho \geq 0.64$

13. The ranking of teachers based on percentages of student growth closely aligns with their ranking on statewide performance standards for teaching proficiency.

No points assigned for supplemental check

0 points	0-1 points	1 point	1-2 points	2 points	2-3 points	3 points
$\rho \leq 0$	$\frac{\rho - 0}{0.10 - 0}$	$\rho = 0.10$	$\frac{\rho - 0.10}{0.25 - 0.10} + 1$	$\rho = 0.25$	$\frac{\rho - 0.25}{0.50 - 0.25} + 2$	$\rho \geq 0.50$

Description of Statistical Analysis Protocols

Check 1. The correlation coefficient between observation and growth among all eligible teachers is within the range of expected magnitude reported in research literature.

Pearson product-moment correlation coefficient (r) is calculated between the teacher observation and growth scores of all eligible teachers. Pearson's coefficient is a measure of the strength and direction of linear association between two variables, which can be written as:

$$r_{xy} = \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum_{i=1}^n (x_i - \bar{x})^2 \sum_{i=1}^n (y_i - \bar{y})^2}}$$

where n is the sample size; x_i and y_i are the person i 's values on x and y (e.g., x = observation score, y = growth score); and \bar{x} and \bar{y} are the sample means of x and y .

Correlation coefficient has a value between -1 (a perfect negative correlation) and $+1$ (a perfect positive correlation). A positive correlation indicates a positive relationship while a negative correlation signifies a negative relationship. For example, when teachers with higher observation scores show higher growth scores, the correlation will be positive; in contrast, when teachers with higher observation scores show lower growth scores, the correlation will be negative. Two correlations with the same numerical value have the same strength whether the correlation is positive or negative. A zero correlation indicates no relationship between the variables. The following guidelines are useful when determining the strength of a correlation: ± 0.1 (small), ± 0.3 (moderate), and ± 0.5 (large) (Cohen, 1988, 1992).

Check 2. District designations of Recognized, Exemplary and Master (REM) teachers are found in similar proportion to designations as determined by the state-wide VAM.

Kendall rank correlation coefficient (τ) is calculated between the designation level that the district has made for their teachers (Master, Exemplary, or Recognized) and the same teachers' designation level that is determined by their value-added (VAM) score (Master, Exemplary, Recognized, or Not Designated). Kendall's coefficient is a measure of the strength and direction of ordinal association between two variables, which can be written as:

$$\tau_{xy} = \frac{n_c - n_d}{\sqrt{(n_0 - n_1)(n_0 - n_2)}}$$

where n is the sample size; $n_0 = \frac{n(n-1)}{2}$; $n_1 = \sum_i \frac{t_i(t_i-1)}{2}$; $n_2 = \sum_j \frac{u_j(u_j-1)}{2}$; n_c is the number of concordant pairs; n_d is the number of discordant pairs; t_i is the number of tied values in the i^{th} group of ties for the first quantity; and u_j is the number of tied values in the j^{th} group of ties for the second quantity. Any pair of observations (x_i, y_i) and (x_j, y_j) , where $i < j$, are said to be concordant if the sort of (x_i, y_i) and (x_j, y_j) agrees—that is, if either both $x_i > x_j$ and $y_i > y_j$ holds or both $x_i < x_j$ and $y_i < y_j$. Otherwise, they are said to be discordant.

For example, the correlation will be $+1$ (a perfect positive correlation) when the agreement between the district's designation and designations if determined by the state-wide VAM model is perfect (i.e., the two rankings are the same). The correlation will be positive when the two designations are similar. The correlation will be -1 (a perfect negative correlation) when the disagreement between the two designations is perfect (i.e., one ranking is the reverse of the other). When the two designations are independent, then the correlation will be approximately zero.

Check 3. District designation decisions for Recognized, Exemplary, and Master teachers, in tested subjects, are in proximity to designations as determined by the state-wide VAM.

For teachers of tested subjects who earned a designation in the district (Master, Exemplary, or Recognized), it is determined whether the district designation is in the same, higher, or lower than the designation if it were determined by the state-wide VAM model. An "accuracy" score ranging from -1.00 to $+1.00$ is assigned based on

the proximity between the district designation and the designation if it were determined by the state-wide VAM model. The table below shows how values are assigned based on proximity:

District designations	Designations if determined by the statewide VAM			
	<i>Not Designated</i>	<i>Recognized</i>	<i>Exemplary</i>	<i>Master</i>
<i>Recognized</i>	0.00	1.00	0.75	0.50
<i>Exemplary</i>	-0.25	0.75	1.00	0.75
<i>Master</i>	-1.00	0.25	0.75	1.00

More points are given when the district designation is closer to the designations if determined by the state-wide VAM model. After a score has been assigned to each teacher, these scores are averaged to produce an overall score for the district.

Check 4. Across campuses, observation scores are similar for teachers in REM groups.

Check 5. Across campuses, percentages of student growth are similar for teachers in REM groups.

Analysis of variance (ANOVA) is performed to compare teachers' observation score (Check 4) or growth score (Check 5) across different campuses. The analysis model includes the main effects of campus and teacher designation (Master, Exemplary, Recognized) as well as their interaction effect. Then, semi-partial omega-squared (ω^2) for the campus effect is calculated. Semi-partial omega-squared is a measure of standardized group difference (effect size)—the proportion of the variance in a dependent variable (e.g., observation or growth score) that is accounted for by the independent variable (e.g., campus), with other effects (terms) in the model parsed out of the independent variable. It can be written as:

$$\text{semi-partial } \omega^2 = \frac{df_{\text{effect}}(MS_{\text{effect}} - MS_{\text{error}})}{df_{\text{effect}}MS_{\text{effect}} + (N - df_{\text{effect}})MS_{\text{error}}}$$

where N is the sample size; df is the degrees of freedom; MS_{effect} is the mean sum of squares for the independent variable; and MS_{error} is the mean sum of squares for the error. (Semi-partial) omega-squared is widely viewed as a lesser biased alternative to (semi-partial) eta-squared, especially when sample sizes are small.

Semi-partial omega-squared can have a value between -1 and $+1$. The following guidelines are useful when determining the strength of a semi-partial omega-squared: 0.01 (small), 0.06 (moderate), and 0.14 (large) (Cohen, 1988, 1992). A zero or negative value indicates no effect of the independent variable when controlling for the other effects included in the model.

Check 6. Across assignments, observation scores are similar for teachers in REM groups.

Check 7. Across assignments, percentages of student growth are similar for teachers in REM groups.

ANOVA is performed to compare teachers' observation score (Check 6) or growth score (Check 7) across different teaching assignments. Teaching assignment is defined as two or more eligible teacher groups; or defined as tested subjects, non-tested subjects, or both subjects when there is only one eligible teacher group. The analysis model includes the main effects of teaching assignment and teacher designation (Master, Exemplary, or Recognized) as well as their interaction effect. Then, semi-partial omega-squared (ω^2) for the teaching assignment effect is calculated.

Check 8. The percentage of students who meet or exceed expected growth in the district is approximately equal to the statewide performance standards for student growth in each of the teacher-designation levels (REM).

Check 9. Observation ratings in the district are approximately equal to the statewide performance standards for teaching proficiency in each of the REM levels.

For teachers who earned a designation in the district (Master, Exemplary, or Recognized), it is determined how close their growth score (Check 8) or observation score (Check 9) is to the published cut-point that corresponds to their

designation category. A closeness score based on the proximity of the growth score or observation score to the corresponding performance standard at each designation level is established on a 0-100% scale. The score value is calculated using an exponential equation that assigns a score based on the proximity of each teacher's score to the corresponding performance standard. More points are given when the score is closer to the performance standard. After a score has been assigned to each teacher, these scores are averaged. The state published cut-points used are shown below:

Growth standard group	% of students meeting or exceeding growth targets
<i>Recognized</i>	55%
<i>Exemplary</i>	60%
<i>Master</i>	70%

Observation standard group	Based on T-TESS	Based on another rubric
<i>Recognized</i>	3.7	74% of points
<i>Exemplary</i>	3.9	78% of points
<i>Master</i>	4.5	90% of points

The exponential equations used are shown below:

In Check 8

For Master teachers,

$$s_i = f(x_i) + g(x_i) \left(\frac{x_i - 0.5}{0.7 - 0.5} \right)^2,$$

$$f(x_i) = \begin{cases} 1 & 0.7 \leq x_i \\ 0 & \text{otherwise} \end{cases}, g(x_i) = \begin{cases} 1 & 0.5 \leq x_i < 0.7 \\ 0 & \text{otherwise} \end{cases};$$

For Exemplary teachers,

$$s_i = f(x_i) \left(\frac{x_i - 0.5}{0.6 - 0.5} \right)^2 + g(x_i) + h(x_i) \left(1 - \frac{x_i - 0.7}{1 - 0.7} \right)^2,$$

$$f(x_i) = \begin{cases} 1 & 0.5 \leq x_i < 0.6 \\ 0 & \text{otherwise} \end{cases}, g(x_i) = \begin{cases} 1 & 0.6 \leq x_i < 0.7 \\ 0 & \text{otherwise} \end{cases}, h(x_i) = \begin{cases} 1 & 0.7 \leq x_i \\ 0 & \text{otherwise} \end{cases};$$

For Recognized teachers,

$$s_i = f(x_i) \left(\frac{x_i - 0.5}{0.55 - 0.5} \right)^2 + g(x_i) + h(x_i) \left(1 - \frac{x_i - 0.6}{1 - 0.6} \right)^2,$$

$$f(x_i) = \begin{cases} 1 & 0.5 \leq x_i < 0.55 \\ 0 & \text{otherwise} \end{cases}, g(x_i) = \begin{cases} 1 & 0.55 \leq x_i < 0.6 \\ 0 & \text{otherwise} \end{cases}, h(x_i) = \begin{cases} 1 & 0.6 \leq x_i \\ 0 & \text{otherwise} \end{cases};$$

where s_i and x_i are the person i 's values on closeness score and growth score, respectively.

In Check 9

For Master teachers,

$$s_i = f(x_i) + g(x_i) \left(\frac{x_i - 0.7}{0.9 - 0.7} \right)^2,$$

$$f(x_i) = \begin{cases} 1 & 0.9 \leq x_i \\ 0 & \text{otherwise} \end{cases}, g(x_i) = \begin{cases} 1 & 0.7 \leq x_i < 0.9 \\ 0 & \text{otherwise} \end{cases};$$

For Exemplary teachers,

$$s_i = f(x_i) \left(\frac{x_i - 0.7}{0.78 - 0.7} \right)^2 + g(x_i) + h(x_i) \left(1 - \frac{x_i - 0.9}{1 - 0.9} \right)^2,$$

$$f(x_i) = \begin{cases} 1 & 0.7 \leq x_i < 0.78 \\ 0 & \text{otherwise} \end{cases}, g(x_i) = \begin{cases} 1 & 0.78 \leq x_i < 0.9 \\ 0 & \text{otherwise} \end{cases}, h(x_i) = \begin{cases} 1 & 0.9 \leq x_i \\ 0 & \text{otherwise} \end{cases};$$

For Recognized teachers,

$$s_i = f(x_i) \left(\frac{x_i - 0.7}{0.74 - 0.7} \right)^2 + g(x_i) + h(x_i) \left(1 - \frac{x_i - 0.78}{1 - 0.78} \right)^2,$$

$$f(x_i) = \begin{cases} 1 & 0.7 \leq x_i < 0.74 \\ 0 & \text{otherwise} \end{cases}, g(x_i) = \begin{cases} 1 & 0.74 \leq x_i < 0.78 \\ 0 & \text{otherwise} \end{cases}, h(x_i) = \begin{cases} 1 & 0.78 \leq x_i \\ 0 & \text{otherwise} \end{cases};$$

where s_i and x_i are the person i 's values on closeness score and observation score, respectively.

Check 10. The proportion of teachers on district campuses who are designated as Recognized, Exemplary, or Master is roughly equivalent to other campuses in the same Domain 2A rating.

The campus cumulative percentage of (1) Master designation, (2) Exemplary or higher designations, or (3) Recognized or higher designations are each compared to a State average of campuses within each of the Domain 2A categories. In other words, the district and state percentages are obtained for teachers within Domain 2A A-rated campuses, Domain 2A B-rated campus, etc. Then, Cohen's w is calculated from each possible comparison in the Domain 2A categories, and a mean value is calculated over the (1), (2), and (3) designation levels.

Cohen's w is a measure of association between two nominal variables. With a binary outcome (e.g., designated vs. not designated), it can be written as follows with directionality considered:

$$w = \text{sign}(p_1 - p_0) \sqrt{\frac{(p_1 - p_0)^2}{p_0} + \frac{(p_1 - p_0)^2}{(1 - p_0)}},$$

where p_1 is the district percentage and p_0 is the statewide expected percentage. The value will be 0 when the district percentage is equal to the statewide percentage for a Domain 2A category. In contrast, the value will be positive when the district percentage is larger than the statewide percentage; or it will be set to zero when the district percentage is smaller than the statewide percentage.

Check 11. The variability in observation ratings among all eligible teachers is within the range of expected magnitude.

Standard deviation (σ) is calculated for the (max-scaled) observation score of all eligible teachers. Standard deviation is a measure of variation or dispersion of a variable, which can be written as:

$$\sigma = \sqrt{\frac{\sum_{i=1}^n (x_i - \bar{x})^2}{n}},$$

where n is the sample size; x_i is the person i 's values on x (e.g., observation score); and \bar{x} is the sample mean of x . A low standard deviation indicates that teachers' observation scores are close to each other and to the mean, while a high standard deviation indicates that scores are spread out over a wider range.

Check 12. The ranking of teachers based on observation scores closely aligns with their ranking on statewide performance standards for teaching proficiency.

Check 13. The ranking of teachers based on percentages of student growth closely aligns with their ranking on statewide performance standards for teaching proficiency.

Spearman rank correlation coefficient (ρ) is calculated between observation scores (Check 12) or growth scores (Check 13) and VAM scores among teachers of tested subjects. Spearman's coefficient is a measure of the strength and direction of monotonic association between the rankings on two variables, which can be written as:

$$\rho_{xy} = \frac{\sum_{i=1}^n (Rx_i - R\bar{x})(Ry_i - R\bar{y})}{\sqrt{\sum_{i=1}^n (Rx_i - R\bar{x})^2 \sum_{i=1}^n (Ry_i - R\bar{y})^2}}$$

where n is the sample size; Rx_i and Ry_i are the person i 's ranks on x and y (e.g., x = observation or growth score, y = VAM score); and $R\bar{x}$ and $R\bar{y}$ are the sample means of Rx and Ry .

For example, the correlation will be +1 (a perfect positive correlation) when there is a perfect agreement between the rankings of teachers within the district on the observation and VAM scores (i.e., the two rankings are identical). The correlation will be positive when the two rankings are similar. The correlation will be -1 (a perfect negative correlation) when there is a perfect disagreement between the two rankings (i.e., one ranking is the exact opposite of the other). When the two rankings are independent, then the correlation will be close to zero.

Data Validation Report Table

<i>Domain</i>	<i>Check</i>	<i>Possible Points</i>	<i>Results</i>	<i>Score</i>	<i>Weight</i>	<i>Score × Weight</i>
<i>A. Correlation between teacher observation ratings and student growth ratings</i>	C1	0-3	$r =$		× 10
